Batch Systems

Running calculations on HPC resources

Outline

- What is a batch system?
- How do I interact with the batch system
 - Job submission scripts
 - Interactive jobs
- Common batch systems
- Converting between different batch systems

Batch Systems

What are they and why are they used?

What is a batch system?

- A batch system controls access to the resources on a machine
- Used to ensure all users get a fair share of resources
 - As machine is usually oversubscribed
- Allows user to setup computational job, place it into batch queue and then log off machine
 - Job will be processed when there is space and time
 - Do not need to be continually logged-in for simulations to run
- Usually assumed that jobs are non-interactive
 - It runs for a time and produces results without intervention from the user
 - (Unlike interactive programs on a laptop.)

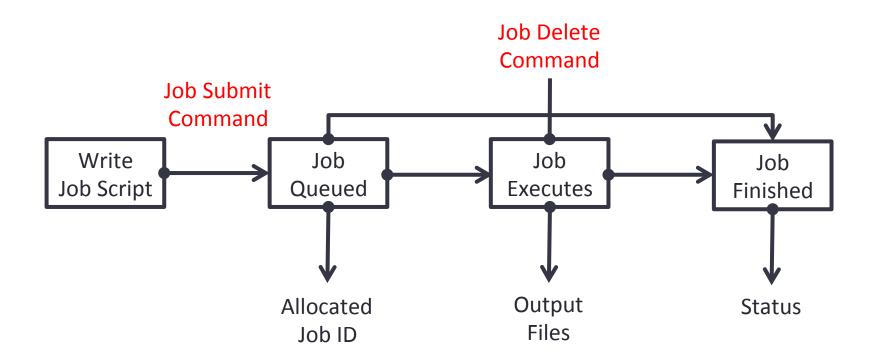

Reservation and Execution

- When you submit a job to a batch system you specify the resources you require:
 - Number of cores, job time,
- The batch system reserves a block of resources for you to use
- You can then use that block as you want, for example:
 - For a single job that spans all cores and full time
 - For multiple shorter jobs in sequence
 - For multiple smaller jobs running in parallel

Batch system flow

Running calculations

Interacting with the batch system

Batch and interactive jobs

- Most resources allow both batch and interactive jobs to be run through the batch system
- Batch jobs are non-interactive.
 - They run without user intervention and you collect the results at the end
 - Write a job submission script to run your job
- Interactive jobs allow you to use the resources interactively
 - For debugging/profiling
 - For visualisation and data analysis
- How you run these types of jobs differs with batch system and site

Job submission scripts

- Contain:
 - Batch system options
 - Commands to run
- Example:

```
#!/bin/bash -login

#PBS -N Weather1

#PBS -l select=171

#PBS -l walltime=1:00:00

cd $PBS_O_WORKDIR

aprun -n 4096 ./weathersim

Parallel job launcher Program name
```

Generic example

```
• #!/bin/bash
                                  how long
 #$ -V
 #$ -1 h rt=:10:
                                  which directory
 #$ -cwd
                                   how many processors
 #$ -pe mpi 4
  mpiexec -n $NSLOTS ./myprogram
                            Program name
Parallel job launcher
```

Common batch systems

Batch systems

- PBS, Torque
- Grid Engine
- SLURM
- LSF IBM Systems
- LoadLeveller IBM Systems

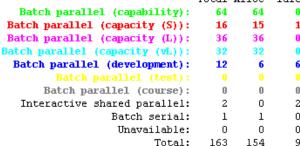

Common concepts

- Queues
 - Portions of machine and time constraints
 - Generally small numbers of defined queues
- Generally specify:
 - Executable name
 - Account name
 - Maximum run time
 - Number of CPUs
 - Output file names/ directories

HPCx (phase3) batch system LPAR allocation status at: 2008-10-20 14:24:30

Control programs

- Monitor, submit, and delete programs
 - qsub
 - qdel
 - qstat

Migrating

Changing your scripts from one batch system to another

Conversion

- Usually need to change the batch system options
- Sometimes need to change the commands in the script
 - Particularly to different paths
 - Usually the order (logic) of the commands remains the same
- There are some utilities that can help
 - Bolt from EPCC, generates job submission scripts for a variety of batch systems/HPC resources: https://github.com/aturner-epcc/bolt

Best practice

- Run short tests using interactive jobs if possible
- Once you are happy the setup works write a short test job script and run it
- Finally, produce scripts for full production runs
- Remember you have the full functionality of the Linux command line available in scripts
 - This allows for sophisticated scripts if you need them
 - Can automate a lot of tedious data analysis and transformation
 - ...be careful to test when moving, copying deleting important data –
 it is very easy to lose the results of a large simulation due to a typo
 (or unforeseen error) in a script
